

v5.1.0

Release Q3 2026

PLATFORMS & APIS

- **Linux**
x64 · RHEL, Ubuntu
- **Windows**
x64 · code signed
- **macOS**
Apple Silicon (ARM64) only · code signed
- **Crypto**
FIPS validated on all platforms
- **Languages**
UXL · C · C++
- **Roadmap**
C# · iOS · Android · Industrial IoT

CRYPTO & COMPLIANCE

- **AES-256**
FIPS 140-3 validated · CMVP certificate
- **Resilience**
Dynamic scheme — quantum & AI resistant, no PKI

FIPS 140-3

ECCN 5D002

AES-256

No PKI

SERVER HUB

- **Library**
libsertaintyserver — superset of Core
- **Services DB**
SQLite or MySQL
- **Host**
SertaintyHttpServer — HTTP API + Workflow
- **Editions**
Enterprise

RELEASES

github.com/Sertainty

ENTERPRISE · SERVER HUB

Data that protects itself

Sertainty Enterprise is the **Server Framework** — everything in the Core Framework, plus an extensible web-service layer, a services database, automated workflows, and multi-user management. Active intelligence protects the data; the server centralizes how that protection is run, audited, and delegated across the organization.

Server Hub

Centralized Auditing

Automated Workflows

Multi-User Management

SERVER HUB · FIVE MANAGED SERVICES

Core Services

Shared metadata, user management, and journaling across the deployment.

Data Service

Server-side UXP Object & Identity creation, plus an event-tracking registry.

Delegate Service

Remote user-access management — authorize & revoke users for UXP Objects.

Utility Service

General-purpose helpers for server-side scripting (file, string, XML).

Workflow Service

Automated file-watching task pipelines for hands-off protection.

ENTERPRISE APPLICATIONS & UTILITIES

No-code applications

Manage IDs, UXPs, services & workflows

- **Sertainty Tech Hub** — author UXP Identities
- **Server Hub** — Workflow, HTTP, Data & Delegate management

Supporting utilities

Developer & server tooling

- **SertaintyScript** — UXL scripting utility
- **SertaintyHttpServer** — hosts services, incl. Workflow
- **SertaintyString** — create secure private strings

KEY CAPABILITIES

◆ Selective & partial access

- *Who* can read what — selective access governs page-level reach.
- *How much* is unprotected — only the portion in use, at runtime.
- *How long* plaintext exists — decrypted just in time, released after use.

◆ Active Intelligence, Active Authorization

Every open triggers a fresh evaluation against the embedded rules: identity, time, location, device, and prior failures.

Access is never unconditional.

◆ Centralized auditing & multi-user management

The services database (SQLite or MySQL) journals access events and manages users centrally across the deployment.

◆ No-code utility applications

Enterprise ships utility apps — Tech Hub, Server Hub and more — that create Identities, protect files, and run operations without writing code.

◆ Offline by default. Airgap ready.

- No server, key manager, or network is needed for access decisions.
- UXP runs identically in connected and airgapped environments.
- Network features are opt-in.

◆ Event log & SIEM

Logging is a preference set by the data owner. When the UXP is online, access events can be sent to a server through several outbound methods, ready for ingest by a SIEM or other monitoring tool.

◆ Web-service API

An extensible HTTP layer (SertaintyHttpServer) exposes UXP operations; each message is sealed with AES-256 and a fresh 12-byte random IV per request.

◆ Self-destruct & Alternate Reality

Configurable defensive responses when access conditions fail: shred the contents, expose decoy data, or revoke the file silently.
